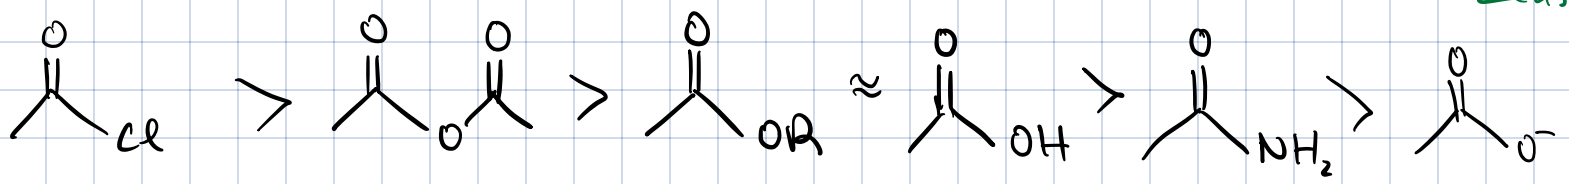
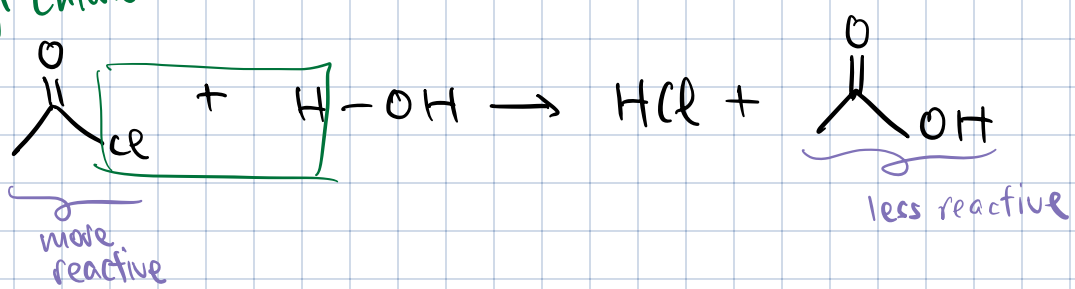
Reactivity

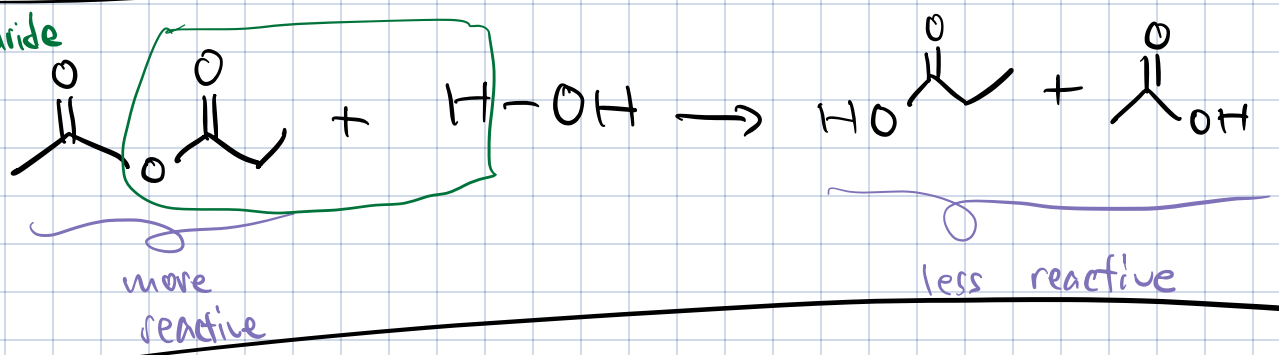
Most Reactive — Least



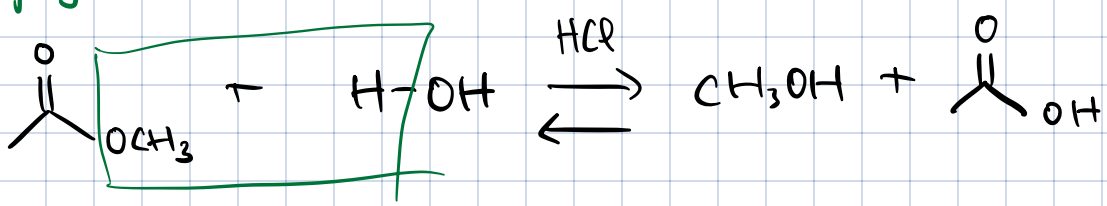
Acyl Chloride



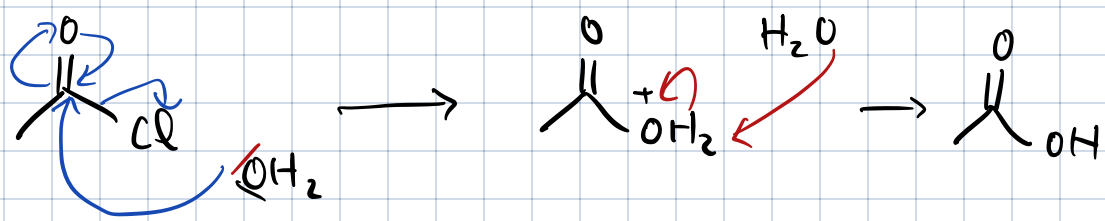
Anhydride



Ester hydrolysis

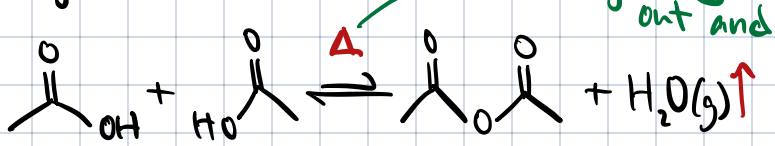


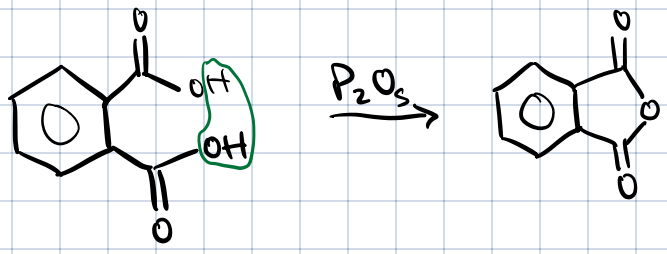
Acyl Chloride mechanism



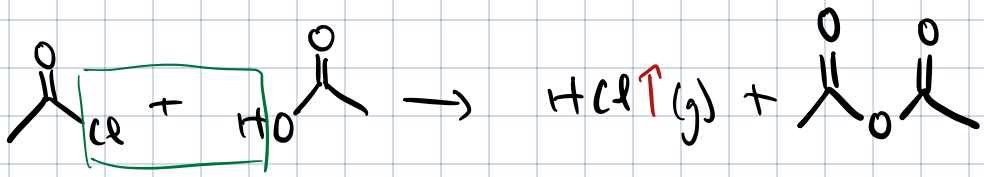
Acid Anhydride formation

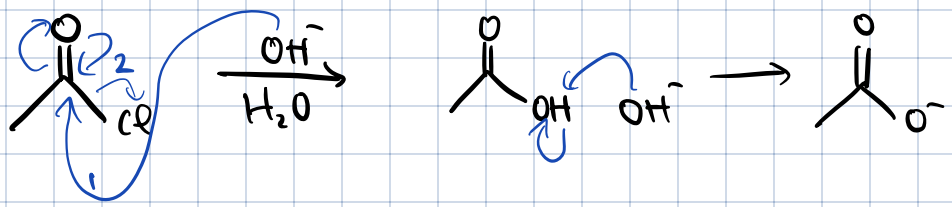
heat/dehydrating agent will drive water out and push rxn fwd by LCP



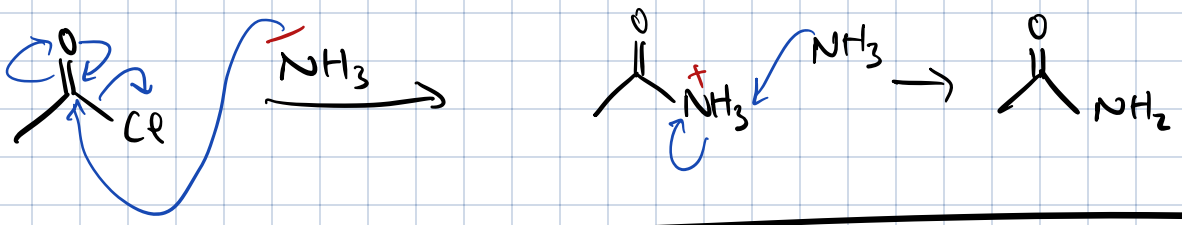


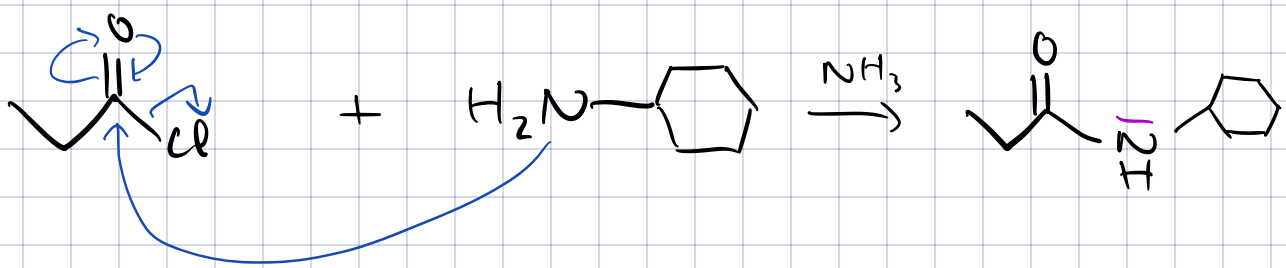
Anhydride from acyl chloride

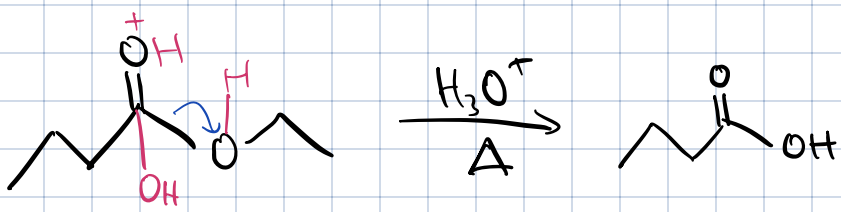


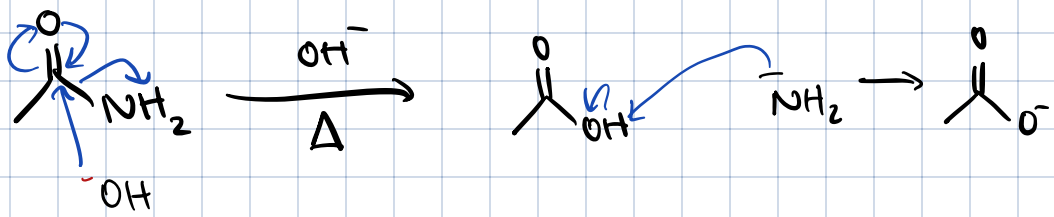


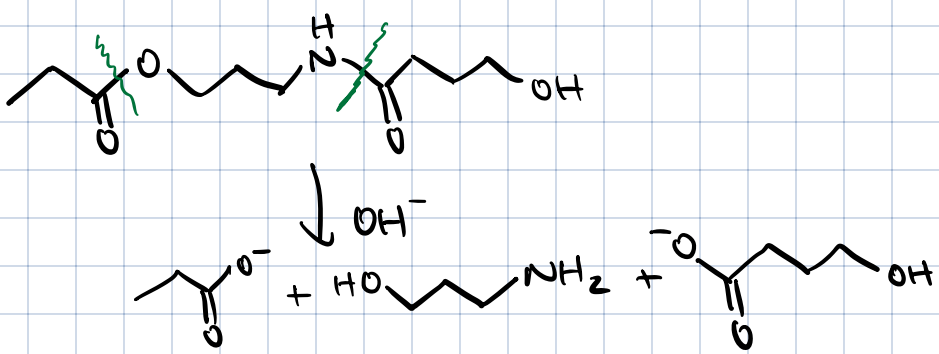
acyl chloride + amine (2020 pt i #69.)

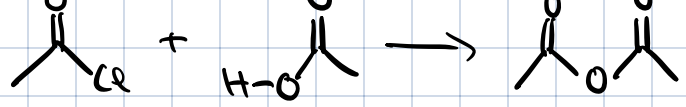




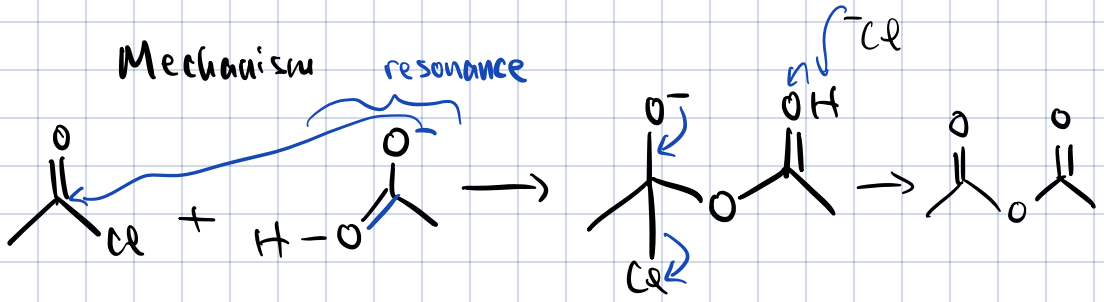




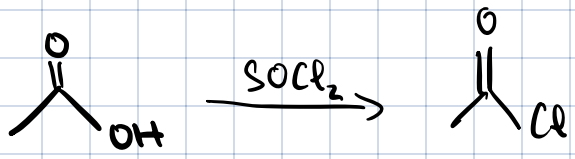


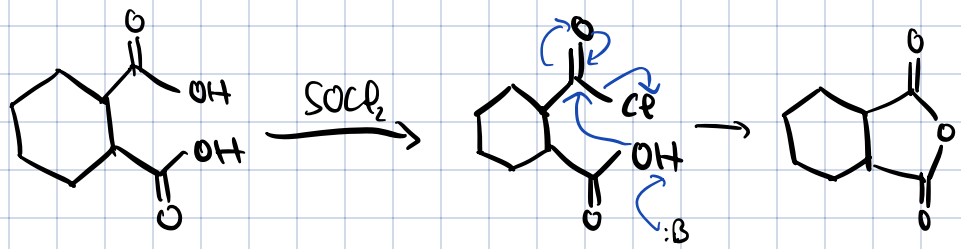


Mechanism

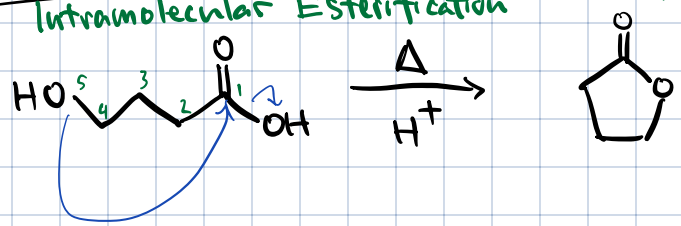


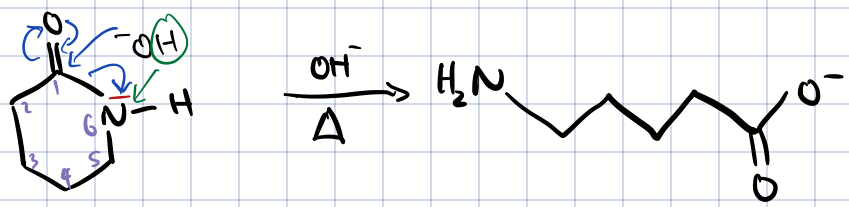
Important! $SOCl_2$



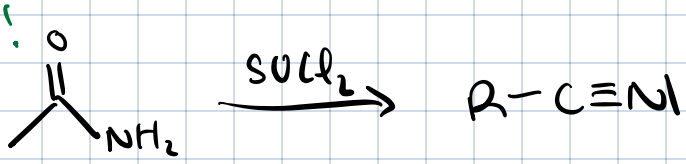


Intramolecular Esterification



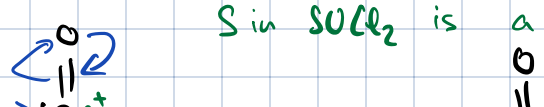


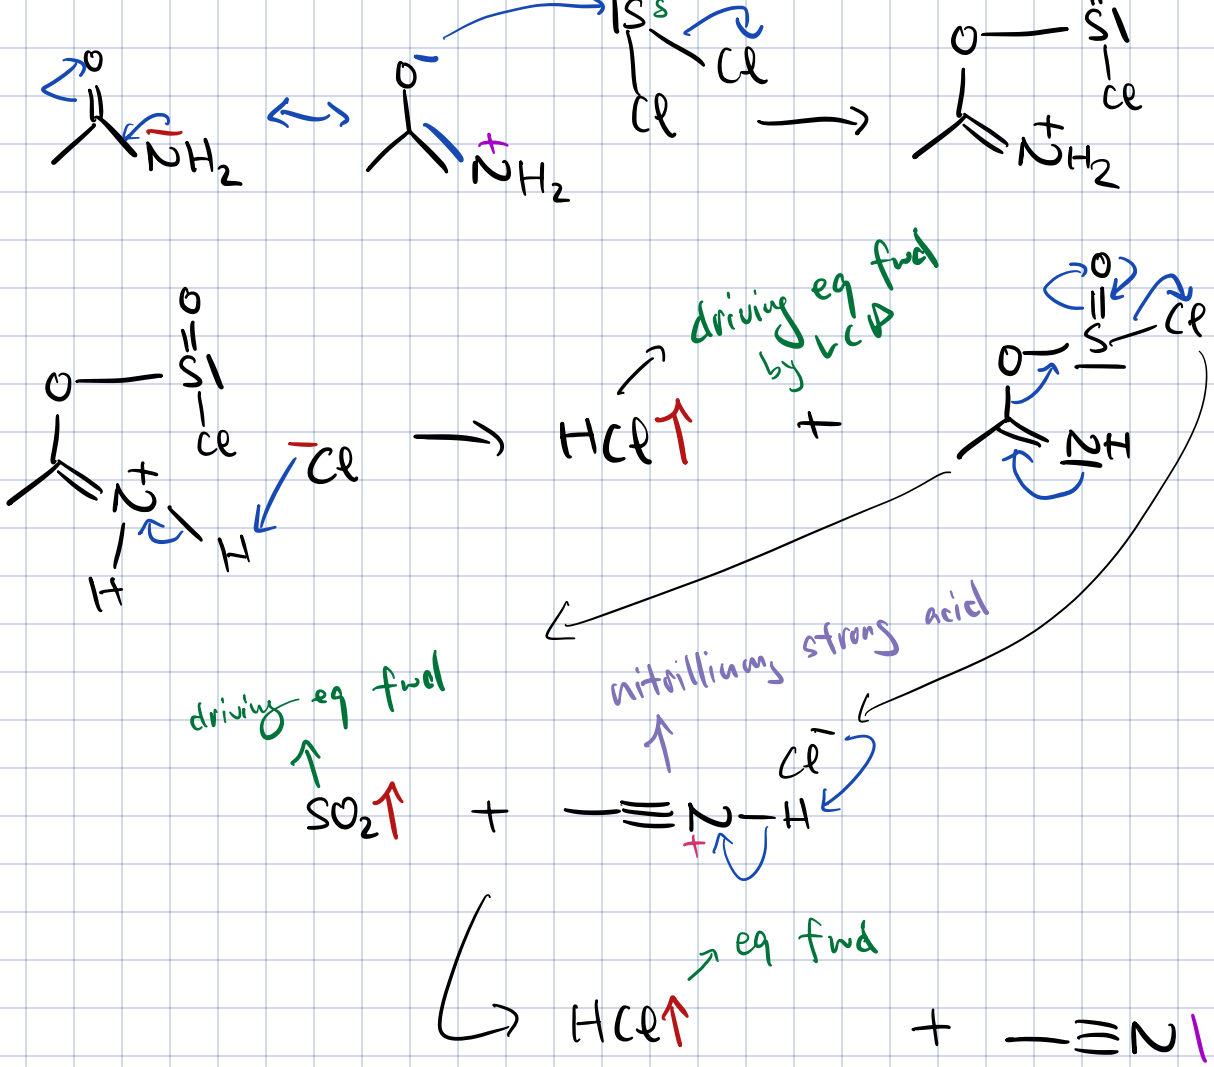
New!



Mechanism

S in $SOCl_2$ is a strong e^- phile





driving eq fwd by LCP
driving eq fwd
nitrilliums strong acid
eq fwd
